## Thin-film transistors on plastic and glass substrate: silicon deposited by microwave plasma ECR-CVD

[Lihong Teng](#) [Anderson, W.A.](#)

Dept. of Electr. Eng., State Univ. of New York, Buffalo, NY, USA

This paper appears in: **Electron Device Letters, IEEE**

Publication Date: June 2003

On page(s): 399 - 401

Volume: 24 , Issue: 6

ISSN: 0741-3106

Inspec Accession Number: 7701417

### Abstract:

Thin-film transistors (TFTs) were fabricated on **polyimide** and glass substrate temperatures using microwave ECR-CVD deposited amorphous and nanocrystalline as active layers. The amorphous Si TFT fabricated at 200 /spl deg/C on the polyimide foil had a saturation region field effect mobility of 4.5 cm/sup 2//V-s, a linear region mobility of 5.1 cm/sup 2//V-s, a threshold voltage of 3.7 V, a subthreshold swing of 0.1 V/decade, and an ON/OFF current ratio of 7.9 /spl times/ 10/sup 6/. This large and high ON/OFF current ratio were attributed to the high-quality channel materials and less dangling bond defect states. Nanocrystalline Si TFTs fabricated on glass substrate at 400 /spl deg/C showed a saturation region mobility of 14.1 cm/sup 2//V-s, a linear region mobility of 15.3 cm/sup 2//V-s, a threshold voltage of 3.6 V, and an ON/OFF current ratio of 6.7 /spl times/ 10/sup 6/. TFT performance was mostly independent of substrate type when fabrication conditions were the same.
